

Automated Disc Importer

Automated Disc Importer ingests medical images and reports from DICOM discs, drastically reducing time and money spent on manual importing.

This advanced workflow solution enables the automated importing of images and reports from outside CDs and DVDs. Users can quickly import batches of discs utilizing a walk-up, touch screen interface.

Hospitals and imaging centers are inundated with discs from outside organizations. The manual importation of data is not only very time consuming, but also very costly.

With Automated Disc Importer, organizations have the added ability of importing volumes of discs into temporary cloud-based or local storage through an automated process, eliminating the need for human intervention. Once discs are read, users may reconcile the data and import into their archive.

As an added security benefit, the Automated Disc Importer takes a photograph of every disc label that is being read. The photograph clearly identifies where the disc was created.
