Enterprise Media Importer + Scan

Easily upload CDs and DVDs and scan documents into your radiology workflow. Reconcile, view and share images and reports brought in from outside sources.

ENTERPRISE MEDIA IMPORTER

Enterprise Media Importer (EMI) streamlines the management of incoming discs, allowing for distribution of patient data that enters your facility from outside sources. EMI enables reconciliation of outside images and data and uploads them into the healthcare enterprise where they can be instantly viewed and shared with authorized users, and/or seamlessly imported into your archive or cloud.

Enhances Productivity

◗ Import an unlimited number of outside discs from any workstation

◗ Enables you to quickly and easily receive, view, reconcile, and manage outside discs

◗ Reconciles and stores images and reports for collaborative viewing and secondary interpretation

◗ Allows disc content to be shared with referring physicians, reducing the need for unnecessary or duplicate procedures

◗ Outside discs sent to the cloud can be viewed online or archived

◗ Provides a process for securely sharing image data without needing to import it to your archive

◗ Audit trail reports capture and store study data, volume of discs imported and the organization that created the discs

SCAN

A powerful addition to the already robust Enterprise Media Importer product, Scan allows users to attach a compatible scanner and seamlessly integrate paper and electronic documents into their radiology workflow.

Scan also allows you to send electronic documents to your archive by using a standard print function to create secondary capture images.

When scanning a paper document or sending an electronic document to your archive, users can enter patient information by hand or select a matching study from a disc, PACS, or modality worklist. Those documents are added to studies as DICOM-standard secondary capture images and become a part of the study for archiving and viewing.
